

Praxis Auth-Web

Centralised, intelligent authorisation management for your enterprise systems.

Praxis Auth-Web is a plug-in authorisation module that governs access to system functionality and data across one or many enterprise systems — from a single installation. It integrates with your existing authentication providers, including Active Directory and Keycloak, giving IT leadership one point of control over who can do what, everywhere.

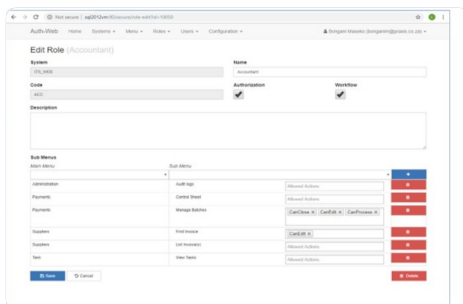

FEATURES AT A GLANCE

- ▶ **Multi-system authorisation** — serve several client systems from one installation, with common and separate roles.
- ▶ **External authentication** — works with Active Directory, Keycloak and other identity providers.
- ▶ **Role-driven menus** — holds each system's menu structure and delivers menus customised to every user's roles.
- ▶ **Admin interface** — a purpose-built UI for system administrators to manage access rights and configuration.
- ▶ **Access audit trail** — maintains system access tracking records for compliance and oversight.

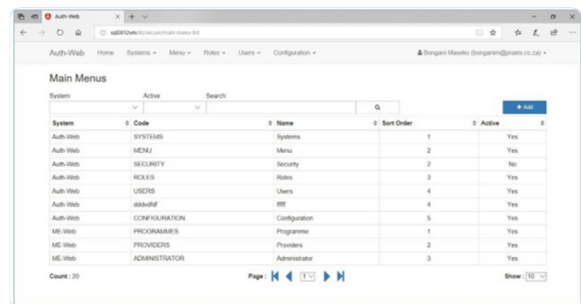

AI-ASSISTED ADMINISTRATION

Query access in plain English. Auth-Web's natural-language interface lets administrators ask questions like “*Who can approve payments in the finance system?*” or “*What did this user access last month?*” — and get immediate, audit-backed answers.

No query languages, no report builders — faster reviews, cleaner audits, better governance.

Role administration — menus, forms and allowed actions per role

Menu management across multiple systems from one console

THE BUSINESS VALUE

One point of control

Consolidate authorisation across your application estate and retire per-system access management.

Audit-ready by design

Built-in access tracking gives you the evidence trail regulators and auditors expect.

Lower cost of change

Plug Auth-Web into new systems as you build them — roles, menus and audit come standard.
